Alveolata includes flagellated protists (dinoflagellates), parasites (apicomplexans), and ciliates. Dinoflagellates are abundant components of marine and freshwater phytoplankton. Dinoflagellates and other phytoplankton form the foundation of most marine and many freshwater food chains. Other species of dinoflagellates are heterotrophic.

Reviewed in the United States on November 27, 2003 Patterson's color guide to free-living freshwater protozoa is probably the most useful of the protozoan identification guides for living protozoa, especially if you are examining the protozoa under phase contrast. Living protozoa do not necessarily look much like some of the drawings in manuals.

This guide is not for species identification, which is impractical for now as most protist groups in Singapore have not been studied by taxonomic specialists. Most of the pages describe freshwater protists. Marine protists are a world of their own and there are no plans to cover them at present.

### **About this Guide | Protists in Singapore**

Members are freshwater protists with typical eukaryotic properties, including two flagella, reproduction by mitosis, and flexible nutritional requirements. Euglena species also possess chlorophyll within chloroplasts. This pigment allows the organisms to synthesize organic compounds in the presence of sunlight.
