The basic cased hole tools can be divided into three general groups: correlation, saturation, and porosity. The correlation device is used to correlate cased hole measurements with open hole measurements and to estimate shale volume. The saturation device is used to determine water saturation when porosity and water salinity are known. The porosity devices are used to estimate porosity when lithology is known.

CASED HOLE LOGGING BASICS Logging through casing began with the gamma ray log in the later part of the 1930's and this tradition has continued to the present. The gamma ray log is used for depth correlation on many logging and wireline services. Most cased hole logs have a GR and casing collar log (CCL) for depth control.

### Crain's Petrophysical Handbook | Through Casing Logs

Well logging, also known as borehole logging is the practice of making a detailed record (a well log) of the geologic formations penetrated by a borehole. The log may be based either on visual inspection of samples brought to the surface (geological logs) or on physical measurements made by instruments lowered into the hole (geophysical logs).
